1 Introduction

Given the opportunity to review the design document and related source code of the Shell token contract, we outline in the report our systematic method to evaluate potential security issues in the smart contract implementation, expose possible semantic inconsistency between smart contract code and the documentation, and provide additional suggestions or recommendations for improvement. Our results show that the given version of the smart contract exhibits no ERC20 compliance issues or security concerns. This document outlines our audit results.

1.1 About Shell

Shell is a normal ERC20-compliant token contract that allows the ShellFactory (the owner) to mint and burn tokens. This audit covers this specific token contract and the ShellFactory contract with a focus on the token's ERC20-compliance and security. The basic information of the audited contract is as follows:

ltem	Description
Name	Shell
Туре	Ethereum ERC20 Token Contract
Platform	Solidity
Audit Method	Whitebox
Audit Completion Date	October 10, 2024

 Table 1.1:
 Basic Information of Shell Token Contract

In the following, we show the Git repository of reviewed files and the commit hash value used in this audit.

• https://github.com/OT-Sea/Shell-EVM.git (c9b7b1a)

And here is the commit ID after all fixes for the issues found in the audit have been checked in.

• https://github.com/OT-Sea/Shell-EVM.git (98ac292)

1.2 About PeckShield

PeckShield Inc. [4] is a leading blockchain security company with the goal of elevating the security, privacy, and usability of current blockchain ecosystem by offering top-notch, industry-leading services and products (including the service of smart contract auditing). We are reachable at Telegram (https://t.me/peckshield), Twitter (http://twitter.com/peckshield), or Email (contact@peckshield.com).

1.3 Methodology

To standardize the evaluation, we define the following terminology based on OWASP Risk Rating Methodology [3]:

- <u>Likelihood</u> represents how likely a particular vulnerability is to be uncovered and exploited in the wild;
- Impact measures the technical loss and business damage of a successful attack;
- Severity demonstrates the overall criticality of the risk;

Likelihood and impact are categorized into three ratings: *H*, *M* and *L*, i.e., *high*, *medium* and *low* respectively. Severity is determined by likelihood and impact and can be classified into four categories accordingly, i.e., *Critical*, *High*, *Medium*, *Low* shown in Table 1.2.

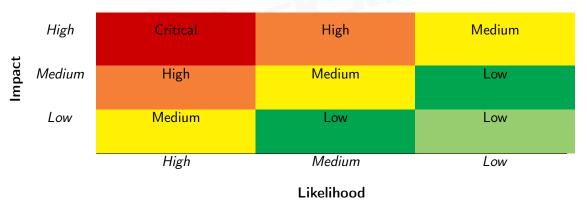

Table 1.2: Vulnerability Severity Classification

We perform the audit according to the following procedures:

• <u>Basic Coding Bugs</u>: We first statically analyze given smart contracts with our proprietary static code analyzer for known coding bugs, and then manually verify (reject or confirm) all the issues found by our tool.

- <u>ERC20 Compliance Checks</u>: We then manually check whether the implementation logic of the audited smart contract(s) follows the standard ERC20 specification and other best practices.
- <u>Additional Recommendations</u>: We also provide additional suggestions regarding the coding and development of smart contracts from the perspective of proven programming practices.

Category	Check Item
	Constructor Mismatch
	Ownership Takeover
	Redundant Fallback Function
	Overflows & Underflows
	Reentrancy
	Money-Giving Bug
	Blackhole
	Unauthorized Self-Destruct
Basic Coding Bugs	Revert DoS
Dasic Coung Dugs	Unchecked External Call
-	Gasless Send
	Send Instead of Transfer
	Costly Loop
	(Unsafe) Use of Untrusted Libraries
	(Unsafe) Use of Predictable Variables
	Transaction Ordering Dependence
	Deprecated Uses
	Approve / TransferFrom Race Condition
ERC20 Compliance Checks	Compliance Checks (Section 3)
	Avoiding Use of Variadic Byte Array
	Using Fixed Compiler Version
Additional Recommendations	Making Visibility Level Explicit
	Making Type Inference Explicit
	Adhering To Function Declaration Strictly
	Following Other Best Practices

Table 1.3: The Full List of Check Items

To evaluate the risk, we go through a list of check items and each would be labeled with a severity category. For one check item, if our tool does not identify any issue, the contract is considered safe regarding the check item. For any discovered issue, we might further deploy contracts on our private testnet and run tests to confirm the findings. If necessary, we would additionally build a PoC to demonstrate the possibility of exploitation. The concrete list of check items is shown in Table 1.3.

1.4 Disclaimer

Note that this security audit is not designed to replace functional tests required before any software release, and does not give any warranties on finding all possible security issues of the given smart contract(s) or blockchain software, i.e., the evaluation result does not guarantee the nonexistence of any further findings of security issues. As one audit-based assessment cannot be considered comprehensive, we always recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contract(s). Last but not least, this security audit should not be used as investment advice.

2 Findings

2.1 Summary

Here is a summary of our findings after analyzing the Shell token contract. During the first phase of our audit, we study the smart contract source code and run our in-house static code analyzer through the codebase. The purpose here is to statically identify known coding bugs, and then manually verify (reject or confirm) issues reported by our tool. We further manually review business logics, examine system operations, and place ERC20-related aspects under scrutiny to uncover possible pitfalls and/or bugs.

Severity	# of Findings
Critical	0
High	0
Medium	0
Low	1
Informational	0
Total	1

Moreover, we explicitly evaluate whether the given contracts follow the standard ERC20 specification and other known best practices, and validate its compatibility with other similar ERC20 tokens and current DeFi protocols. The detailed ERC20 compliance checks are reported in Section 3. After that, we examine a few identified issues of varying severities that need to be brought up and paid more attention to. (The findings are categorized in the above table.) Additional information can be found in the next subsection, and the detailed discussions are in Section 4.

2.2 Key Findings

Overall, no ERC20 compliance issue was found and our detailed checklist can be found in Section 3. While there is no critical issue, the implementation can be improved by resolving the identified issue (shown in Table 2.1), including 1 low-severity vulnerability.

Table 2.1: Key Shell Audit Findings

ID	Severity	Title	Category	Status
PVE-001	Low	Redundant State/Code Removal	Coding Practices	Resolved

Besides recommending specific countermeasures to mitigate the above issue(s), we also emphasize that it is always important to develop necessary risk-control mechanisms and make contingency plans, which may need to be exercised before the mainnet deployment. The risk-control mechanisms need to kick in at the very moment when the contracts are being deployed in mainnet. Please refer to Section 3 for our detailed compliance checks and Section 4 for elaboration of reported issues.

3 ERC20 Compliance Checks

The ERC20 specification defines a list of API functions (and relevant events) that each token contract is expected to implement (and emit). The failure to meet these requirements means the token contract cannot be considered to be ERC20 -compliant. Naturally, as the first step of our audit, we examine the list of API functions defined by the ERC20 specification and validate whether there exist any inconsistency or incompatibility in the implementation or the inherent business logic of the audited contract(s).

ltem	Description	Status
name()	Is declared as a public view function	1
name()	Returns a string, for example "Tether USD"	1
symbol()	Is declared as a public view function	1
symbol()	Returns the symbol by which the token contract should be known, for	1
	example "USDT". It is usually 3 or 4 characters in length	
decimals()	Is declared as a public view function	1
uecimais()	Returns decimals, which refers to how divisible a token can be, from 0	1
	(not at all divisible) to 18 (pretty much continuous) and even higher if	
	required	
totalSupply()	Is declared as a public view function	1
totalSupply()	Returns the number of total supplied tokens, including the total minted	✓
	tokens (minus the total burned tokens) ever since the deployment	
balanceOf()	Is declared as a public view function	1
balanceOI()	Anyone can query any address' balance, as all data on the blockchain is	1
	public	
allowance()	Is declared as a public view function	1
anowance()	Returns the amount which the spender is still allowed to withdraw from	1
	the owner	

Table 3.1:	Basic View-Only	Functions	Defined in	n The ERC20	Specification
------------	-----------------	-----------	------------	-------------	---------------

Our analysis shows that there is no ERC20 inconsistency or incompatibility issue found in the audited Shell token contract. In the surrounding two tables, we outline the respective list of basic view-only functions (Table 3.1) and key state-changing functions (Table 3.2) according to the widely-adopted ERC20 specification.

ltem	Description	Status
	Is declared as a public function	1
	Returns a boolean value which accurately reflects the token transfer status	1
transfor()	Reverts if the caller does not have enough tokens to spend	1
transfer()	Allows zero amount transfers	1
	Emits Transfer() event when tokens are transferred successfully (include 0	\checkmark
	amount transfers)	
	Reverts while transferring to zero address	1
	Is declared as a public function	1
	Returns a boolean value which accurately reflects the token transfer status	1
	Reverts if the spender does not have enough token allowances to spend	1
	Updates the spender's token allowances when tokens are transferred suc-	1
transferFrom()	cessfully	
	Reverts if the from address does not have enough tokens to spend	1
	Allows zero amount transfers	1
	Emits Transfer() event when tokens are transferred successfully (include 0	1
	amount transfers)	
	Reverts while transferring from zero address	1
	Reverts while transferring to zero address	\checkmark
	Is declared as a public function	1
	Returns a boolean value which accurately reflects the token approval status	✓
approve()	Emits Approval() event when tokens are approved successfully	✓
	Reverts while approving to zero address	1
Transfor() avert	Is emitted when tokens are transferred, including zero value transfers	1
Transfer() event	Is emitted with the from address set to $address(0x0)$ when new tokens	1
	are generated	
Approval() event	Is emitted on any successful call to approve()	1

Table 3.2: Key State-Changing Functions Defined in The ERC20 Specification

In addition, we perform a further examination on certain features that are permitted by the ERC20 specification or even further extended in follow-up refinements and enhancements, but not required for implementation. These features are generally helpful, but may also impact or bring certain incompatibility with current DeFi protocols. Therefore, we consider it is important to highlight them as well. This list is shown in Table 3.3.

Table 3.3: Additional Opt-in Features Examined in Our Audit

Feature	Description	Opt-in
Deflationary	Part of the tokens are burned or transferred as fee while on trans-	—
	fer()/transferFrom() calls	
Rebasing	The balanceOf() function returns a re-based balance instead of the actual	—
	stored amount of tokens owned by the specific address	
Pausable	The token contract allows the owner or privileged users to pause the token	—
	transfers and other operations	
Upgradable	The token contract allows for future upgrades	_
Whitelistable	The token contract allows the owner or privileged users to whitelist a	—
	specific address such that only token transfers and other operations related	
	to that address are allowed	
Mintable	The token contract allows the owner or privileged users to mint tokens to	1
	a specific address	
Burnable	The token contract allows the owner or privileged users to burn tokens of	1
	a specific address	

4 Detailed Results

4.1 Redundant State/Code Removal

- ID: PVE-001
- Severity: Low
- Likelihood: Low
- Impact: Low

• Category: Coding Practices [2]

• Target: ShellFactory

• CWE subcategory: CWE-563 [1]

Description

The ShellFactory contract is designed to hold locked funds and release them to users after the unlock timestamps. During the analysis of this ShellFactory contract, we notice it has a redundant parent contract Ownable, which can be safely removed.

In the following, we show its constructor routine, i.e., **constructor()**. This routine is given a parameter _multiSigAdmin with the intention of have a multi-sig admin account to act as the privileged owner. However, this factory contract does not have any privileged functions that need to be guarded with the onlyOwner modifier.

```
contract ShellFactory is Ownable, TransferHelper {
35
36
       /**
37
        * @dev underlying token => unlock timestamp => ShellToken contract
38
        */
39
        mapping(ERC20 => mapping(uint256 => ShellToken)) public shellTokens;
40
        uint256 private constant FRIDAY_20_SEPTEMBER_2024_3PM_CT = 1726862400;
41
42
43
        constructor(address _multiSigAdmin) Ownable(_multiSigAdmin) {
44
        }
45
        . . .
46
  }
```

Listing 4.1: The ShellFactory Contract

Recommendation Consider the removal of the Dwnable parent contract as well as the need of the input parameter for the above constructor() routine.

Status This issue has been resolved by the following commit: 80835c6.

5 Conclusion

In this security audit, we have examined the Shell contract design and implementation. During our audit, we first checked all respects related to the compatibility of the ERC20 specification and other known ERC20 pitfalls/vulnerabilities and found no issue in these areas. We then proceeded to examine other areas such as coding practices and business logics. Overall, no issue was found in these areas, and the current deployment follows the best practice. Meanwhile, as disclaimed in Section 1.4, we appreciate any constructive feedbacks or suggestions about our findings, procedures, audit scope, etc.
